READ AND KEEP THIS MANUAL FOR REFERENCE

This manual is available for free download on the manufacturer's web site. It is a copyrighted document. Re-sale is strictly prohibited. The manufacturer may update this manual from time to time and cannot be responsible for problems, injuries, or damages arising out of the use of information contained in any manual obtained from unauthorized sources.

INTRODUCTION

SBI INC., one of the most important wood stove and fireplace manufacturers in Canada, congratulates you on your purchase and wishes to help you get maximum satisfaction from your wood stove. In the pages that follow, we will give you advice on wood heating and controlled combustion as well as technical specifications regarding installation, operation and maintenance of the model you have chosen.

The instructions pertaining to the installation of your wood stove comply with ULC-S628 and UL-1482 standards.

We recommend that our woodburning hearth products be installed and serviced by professionals who are certified in the United States by NFI (National Fireplace Institute®) or in Canada by WETT (Wood Energy Technical Training) or in Quebec by APC (Association des Professionnels du Chauffage).

Read this entire manual before you install and use your new stove. If this stove is not properly installed, a house fire may result. To reduce the risk of fire, follow the installation instructions. Failure to follow instructions may result in property damage, bodily injury, or even death.

Consult your municipal building department or fire officials about restrictions and installations requirements in your area and the need to obtain a permit.

Keep this instructions manual for future references.

CAUTIONS:

- THE INFORMATION GIVEN ON THE CERTIFICATION LABEL AFFIXED TO THE APPLIANCE ALWAYS OVERRIDES THE INFORMATION PUBLISHED, IN ANY OTHER MEDIA (OWNER'S MANUAL, CATALOGUES, FLYERS, MAGAZINES AND/OR WEB SITES).
- HOT WHILE IN OPERATION. KEEP CHILDREN, CLOTHING AND FURNITURE AWAY. CONTACT MAY CAUSE SKIN BURNS.
- DO NOT USE CHEMICALS OR FLUIDS TO IGNITE THE FIRE.
- DO NOT LEAVE THE STOVE UNATTENDED WHEN THE DOOR IS SLIGHTLY OPENED.
- DO NOT BURN WASTES, FLAMMABLE FLUID SUCH AS GASOLINE, NAPHTHA OR MOTOR OIL.
- DO NOT CONNECT TO ANY AIR DISTRIBUTION DUCT OR SYSTEM.
- ALWAYS CLOSE THE DOOR AFTER THE IGNITION.

REGISTER YOUR WARRANTY ONLINE

To receive full warranty coverage, you will need to show evidence of the date you purchased your insert. Keep your sales invoice. We also recommend that you register your warranty online at

<http://www.osburn-mfg.com/warranty-registration.aspx>

Registering your warranty online will help us track rapidly the information we need on your insert.

Section 1.0 Pre-Installation Requirements

1.1 Masonry & Zero Clearance Requirements

The masonry fireplace must meet the minimum code requirements, or NFPA 211 or the equivalent for a safe installation. Contact your local Building Inspector for requirements in your area. An inspection of the fireplace should include the following:

1. **CONDITION OF THE FIREPLACE AND CHIMNEY:** Examine the masonry fireplace and chimney prior to installation, to determine that they are free from cracks, loose mortar, creosote deposits, blockage, or other signs of deterioration. If evidence of deterioration is noted, the fireplace or chimney should be upgraded prior to installation.
2. **INSTALLATION INTO AN EXISTING FACTORY-BUILT ZERO-CLEARANCE FIREPLACE:** It is possible to install a wood insert into an existing factory-built zero-clearance fireplace. However, there currently exists no UL or ULC standard specific to that type of installation. The first thing that must be verified is that the factory-built zero clearance fireplace is listed (it must be certified by a competent certification body such as Omni or Warnock Hersey). It must be suitable for use with solid fuel and nothing in the owner's manual must specifically prohibit the installation of a fireplace insert. When in doubt, check with the fireplace manufacturer. The installation of the zero-clearance fireplace **MUST** be thoroughly inspected by a professional in order to ensure that it still meets the manufacturer's specs and code conformity. The chimney must be of at least 1" (25 mm) larger in diameter to accommodate a required continuous stainless steel liner running from the flue collar to the top of the chimney termination. Never remove parts that serve to insulate the zero-clearance fireplace from combustible material. Only readily detachable parts that are easily replaced, such as damper parts, screens, and doors, are to be removed from the fireplace. These parts must be stored nearby and available for retrofit if the insert is ever removed. Removal of any parts which render the fireplace unfit for use with solid fuel requires the fireplace to be permanently labelled by the installer as being no longer suitable for solid fuel until the removed parts are replaced and the fireplace is restored to its original certified condition. Furthermore, any air vents, grilles, or louvers that serve to create an air circulation pattern around and outside the zero-clearance fireplace shall never be removed.
3. **CHIMNEY CAPS:** Mesh type chimney caps must have provision for regular cleaning, or the mesh should be removed to eliminate the potential of plugging.
4. **LINER:** The chimney must have an acceptable masonry liner suitable for solid fuel, otherwise a continuous stainless steel liner must be installed.
5. **ADJACENT COMBUSTIBLES:** The fireplace should be inspected to make sure that there is adequate clearance to combustibles, both exposed combustibles to the top, side, and front as well as concealed combustibles, in the chimney and mantel area. Your local inspector should have information on whether older fireplaces are of adequate construction.

6. **OPENING SIZE:** Refer to “*Suitable Fireplace Dimensions*” (Sec. 2.2) for suitable size fireplace openings.

NOTE: A METAL TAG IS PROVIDED AND IS TO BE FASTENED TO THE BACK WALL OF THE FIREPLACE, IF THE FIREPLACE HAS BEEN MODIFIED TO ACCOMMODATE THE INSERT.

1.2 Venting Requirements

The flue is a critical component to a satisfactory installation. Your Osburn insert will attain its best performance if installed with a chimney that generates its own draft. The minimum requirement of a flue will be the installation of a flue connector (the liner must conform to UL1777 chimney liners) from the insert into the first flue tile of the chimney (USA), see Figure 2.6a, or a continuous stainless steel liner (the liner must conform to the Class 3 requirements of CAN/ULC-S635) directly connected to the flue outlet (Canada), see Figure 2.6b. A continuous 6" (152mm) stainless steel liner from the top of the chimney is the optimum system and will provide the best performance, as well as compensate for poor draft situations caused by large cross-sectional chimneys. The insert will not work without a positive seal in the chimney.

Chimneys constructed outside of the home, on an exterior wall, should be avoided if possible, especially in colder climates. Outside chimneys may not draw as well and may downdraft due to the difficulty in heating them up to operating temperature. Cooler chimneys will result in increased creosoting, less draft, and poorer performance. Draft is proportional to overall chimney height as well as to stack temperature. Draft can be increased by increasing chimney height, and by reducing heat loss from the chimney through an insulated liner.

Ensure that all joints in the flue systems are tightly sealed, since any leaks will result in reduced performance as well as a possible safety hazard.

This heating unit must serve as a supplementary heat source. An alternate heat source should be available in the home if needed. The manufacturer cannot be responsible for additional heating costs associated with the use of an alternative heat source.

It is highly recommended that the user buys this product from a retailer who can provide installation and maintenance advices.

Section 2.0 Installation

2.1 Safety Information

NOTE: This appliance is not recommended for use in a home if an occupant has any respiratory or any other related problems.

1. It is important to follow the installation and operation instructions. An improperly installed or operated insert could result in a safety hazard or fire, or damage to the unit, which would not be covered by the warranty. Contact local building or fire officials about restrictions and installation requirements in your area. You should be familiar with the installation and be sure that the work is done in accordance with this manual.

WARNING: DO NOT INSTALL THIS INSERT IN A SLEEPING ROOM.

2. Where lesser clearances are desired, consult your local authority as regulations may vary regarding the use of clearance reducing devices. Listed wall and floor shields are available to reduce clearances, and most building codes provide information on materials which may be used to reduce clearances.
3. Maintain at least the minimum clearances to combustible material as specified in this manual. Clearances are measured to the nearest part of the insert (i.e. top edge on the side). Clearances to any combustibles, when measured directly out from the front, must be a minimum of 48" (1219mm).
4. Maintain at least the minimum floor protection for combustible floor materials as specified in this manual. Floor protection to the front is to be measured from the fuel loading door opening.
5. Osburn recommends that you install a listed smoke detector or alarm in your home. Normal operation of the insert will have no effect on the detector or alarm.
6. The insert is to be connected only to a lined masonry chimney and masonry fireplace conforming to building codes for use with solid fuel. Do not remove bricks or mortar from the existing fireplace when installing the insert.
7. Minimum chimney size is 6" (152mm) diameter. Maintain a 15' (4.5m) minimum overall height measured from the base of the appliance. Chimneys should be inspected to check for deterioration and to determine if they meet the minimum requirements, and be upgraded if necessary. The chimney must extend at least 3' (914mm) above the roof and at least 2' (610mm) above the highest point within an area of 10' (3m) of the chimney.
8. Do not use makeshift compromises during installation, as they could create a safety hazard and a fire could result.
9. ***DO NOT CONNECT THIS APPLIANCE TO THE CHIMNEY OR FLUE SERVING ANOTHER APPLIANCE.***

2.2 Installation Instructions

Inspect the fireplace according to the safety information and fireplace requirements and have it cleaned and/or upgraded if necessary.

2.3 Compliance of the masonry fireplace

Where the masonry fireplace opening is 6 ft² (0.56 m²) or larger, the hearth extension shall extend at least 20" (508 mm) in front of the facing material and at least 12" (305 mm) beyond each side of the fireplace opening. Where the fireplace opening is less than 6 ft² (0.56 m²), the hearth extension shall extend at least 16" (406 mm) in front of the facing material and at least 8" (203 mm) beyond each side of the fireplace opening.

Note that if you must modify the hearth extension to comply with these measures, depending on the size of the masonry fireplace opening, the hearth extension must have a minimum of 4" (102 mm) thick (see Figure 2.5a and 2.5b.)

2.4 The masonry fireplace's draft control system

If the fireplace's draft control system gets in the way of the installation of the insert, you must either block it in the open position or remove it entirely. If you remove draft control system from the masonry hearth, you will need to install the metal plate (27009), supplied with the owner's manual kit, indicating that the masonry hearth has been modified. It must be secured inside the masonry hearth, in a visible place and easy to locate.

THIS FIREPLACE MAY HAVE BEEN ALTERED TO ACCOMMODATE A FIREPLACE INSERT AND SHOULD BE INSPECTED BY A QUALIFIED PERSON PRIOR TO RE-USE AS A CONVENTIONAL FIREPLACE.

⊙ CE FOYER A PEUT-ÊTRE ÉTÉ MODIFIÉ AFIN DE RECEVOIR UN APPAREIL ENCASTRABLE. IL DOIT DONC ÊTRE VÉRIFIÉ PAR UNE PERSONNE QUALIFIÉE AFIN DE DÉTERMINER SA CONFORMITÉ AU CODE LOCAL AVANT DE LE RÉUTILISER. ⊙

27009

2.5 Positioning the unit

In addition to ensuring compliance of the masonry fireplace hearth extension (see *Compliance of the masonry fireplace* section), it is necessary to have a floor protection made of non-combustible materials that meets the measurements specified in table **FLOOR PROTECTION**. To determine the need to add a floor protection (D) beyond the hearth extension, you must do the following calculation using the data in Table **Data for floor protection calculation**: $D = B - (A - C)$. If the value (D) is negative or zero, you do not have to add more floor protection in front of the unit, because the masonry fireplace hearth extension is long enough. If the value (D) is positive, you will need a floor protection in front of the hearth extension at least equivalent to the result (D).

Here is a sample calculation to determine the need to add a non-combustible materials floor protection. For someone whose fireplace opening is less than 6 ft² and which the insert would protrude 3" (76 mm) into the room (C) the calculation would be:

$$\text{Value D} = B - (A - C)$$

$$\text{Value D} = 21 \frac{5}{8}'' - (16'' - 3'')$$

$$\text{Value D} = 21 \frac{5}{8}'' - 13''$$

$$\text{Value D} = 7 \frac{3}{8}''$$

This person should install a non-combustible floor protection of at least **7 3/8" (187 mm)** in front of the hearth.

If a non-combustible material floor protection needs to be added in front and level with the hearth extension masonry fireplace (see Figure 2.5a), an R factor equal to or greater than 1.00 is required. If the extension of the masonry hearth is raised at least 4" from the floor protection, a non-combustible material is sufficient.

The use of an R value is convenient when more than one material is going to be used in the hearth extension to cover the combustible surface. This is because R values are additive, whereas K values are not. To find the corresponding R factor to use for some selected materials, please see table *Thermal characteristics of common floor protection materials*.

Example:

Required floor protection R of 1.00. Proposed materials: four inches of brick and one inch of Durock[®] board

Four inches of brick ($R = 4 \times 0,2 = 0,8$) plus 1 inch of Durock[®] ($R = 1 \times 0.52 = 0.52$).

$$0.8 + 0.52 = \mathbf{1.32}.$$

This R value is larger than the required 1.00 and is therefore **acceptable**

In the case of a known **K** and thickness of alternative materials to be used in combination, convert all **K** values to **R** by dividing the thickness of each material by its **K** value. Add the **R** values of your proposed materials as shown in the previous example.

Example:

K value = 0.75

Thickness = 1

R value = Thickness/K = 1/0.75 = 1.33

Thermal characteristics of common floor protection materials*

MATERIAL	CONDUCTIVITY (k) PER INCH	RESISTANCE (R) PER INCH THICKNESS
Micore [®] 160	0.39	2.54
Micore [®] 300	0.49	2.06
Durock [®]	1.92	0.52
Hardibacker [®]	1.95	0.51
Hardibacker [®] 500	2.3	0.44
Wonderboard [®]	3.23	0.31
Cement mortar	5.00	0.2
Common brick	5.00	0.2
Face brick	9.00	0.11
Marble	14.3 – 20.00	0.07 – 0.05
Ceramic tile	12.5	0.008
Concrete	1.050	0.950
Mineral wool insulation	0.320	3.120
Limestone	6.5	0.153
Ceramic board (Fibremax)	0.450	2.2
Horizontal still air** (1/8")	0.135	0,920**

* Information as reported by manufacturers and other resources

** For a 1/8" thickness. You cannot «stack» horizontal still air to accumulate R-values; you must separate each later of horizontal still air with another noncombustible material.

Figure 2.5a

Figure 2.5b

Data for floor protection calculation

	A		B (Note 1)	C	E
	Smaller than 6 ft ² *	Bigger or = to 6 ft ² *			
INCHES	16"	20"	21 5/8"	5 1/4"	11 7/8"
MILLIMETRES	406 mm	508 mm	550 mm	133 mm	302 mm

*Refers to masonry fireplace opening.

2.6 Minimum masonry opening, clearances to combustibles, and floor protector

	MINIMUM MASONRY OPENING
J	22 5/8" (575 mm)
K	26 1/4" (667 mm)
L	17 3/8" (441 mm)

	CLEARANCES
F	17" (435 mm)
G	10" (255 mm)
H	14" (360 mm)
I	22" (560 mm)

	FLOOR PROTECTOR	
	CANADA	USA
B	21 5/8" (549 mm) – Note 1	21 5/8" (549 mm) – Note 1
M	8" (203 mm)	N/A (Canada only)
N	N/A (USA only)	8" (203 mm)

Note 1: From door opening. Note that this model in particular must have 16 inches in front of the blower housing. This distance is already included in the B value of **Figures 2.5a and 2.5b**. The depth of a non-combustible shelf in front of the insert is included in the calculation of the floor protector's dimensions.

IMPORTANT: The masonry hearth should be at least 4 inches (102 mm) higher than the combustible floor in front of it. If the hearth elevation is lower than 4 inches, the non-combustible floor protector in front of the insert should have an R value equal or greater than 1.00.

2.7 Connector installation

A masonry flue connector may provide acceptable performance (Figure 2.7a); however, we recommend the use of a chimney liner (rigid or flexible) to ensure satisfactory performance (Figure 2.7b). Slip connectors for continuous liners should also be installed. Use Listed Chimney Liners – UL1777, CAN/ULC-S635.

Figure 2.7a

Figure 2.7b

ATTENTION INSTALLER: When positioning the unit in a fireplace opening prior to the flue installation, install the insert into the opening until the top lip of air jacket is flush with fireplace facing.

If lag-bolts and anchors are to be used to secure the insert, the hole locations should be marked with the unit in place. Remove the insert and secure the anchors.

2.7.1 Chimney liner installation

To install the chimney liner, the preferred methods are those found in Section 2.7.1.1. Use a liner offset adapter (Section 2.7.1.2) only as a last resort.

2.7.1.1 If the chimney liner does align with the insert's flue outlet, you have two options:

- A) Install the chimney liner starter adapter, provided with the chimney liner. Follow the chimney liner starter adapter manufacturer's instructions.

In order to connect the chimney liner starter adapter to the flue outlet, you can install the **brackets** with the screws that are located in the instruction manual kit.

Using a powered driver, secure the three brackets with the three screws provided 30131 on top of the air jacket of the insert in the three holes in front of the flue outlet. The long end of the brackets must be attached to the air jacket of the insert. Insert the chimney liner into the flue collar of the unit and secure the liner to the brackets with three self-tapping screws (not included).

- B) You can get from your dealer a liner fixation system (AC02006), sold separately. Follow the installation instructions provided with the liner fixation system.

2.7.1.2 If the chimney liner does not align with the insert's flue outlet:

You can get a liner offset adapter (AC01370), sold separately. If you must install a liner offset adapter, using a powered driver, secure the three brackets with the three screws provided 30131 on top of the insert in the three holes in front of the flue outlet. The brackets and screws are in the insert's instruction manual kit. Then follow the instructions in the manual provided with the liner offset adapter kit.

2.8 General instructions for the air control mechanism, the faceplate and the blower assembly.

2.8.1 Air control mechanism:

All parts of this assembly are shipped in the combustion chamber of the insert. Fix the air control plate to the air control extension lever using the 1/4" x 1" hex head screws and nuts as shown in Figure 2.8.1a and 2.8.1b.

Figure 2.8.1a

Figure 2.8.1b

2.8.2 Assembling the faceplate:

1. Place the faceplate panels, the finished side down on a flat, soft and nonabrasive surface.
2. Assemble the faceplate trim by setting the mitered corners using corner brackets. (See Figure 2.8.2a.)
3. Align the holes in the top with the ones in the right and left side panels and secure using the six (6) screws, washers and nuts. (See Figure 2.8.2b.)
4. Slide the assembled trim over the edges of the faceplate.
5. Secure the trim to the faceplate using the eight "U" shaped clips. (See Figure 2.8.2b.)

Figure 2.8.2a

Figure 2.8.2b

2.8.3 Installation of the faceplate and air control plate on the unit

Step 1: Remove the screw securing the top decorative louver assembly using a powered-screwdriver as shown in the figure below. Discard the screw.

Step 2: Remove the top decorative louver assembly as shown in the figure below.

Step 3: Remove the door off its hinges by pulling it upwards as shown below.

Step 4: Remove the bottom louver kit by lifting it slightly to release the assembly from the attachment bracket.

Step 5: Insert the assembled air control mechanism, from the right hand side, in the track reserved for this purpose under the firebox.

Step 6: Put the assembled faceplate on the appliance.

Step 7: Secure the faceplate to the unit using 4 screws #10 x 3/8" provided in the faceplate kit. Make sure that the stem of the air control extension comes out of the slot made in the right pane of the faceplate and that it moves freely from left to right.

Step 8: Put the bottom louver assembly back in place and secure it using the fastener clips welded to the unit.

Step 9: Put the door back on its hinges.

Step 10: Put the top louver assembly back into place and secure using the fastener clips located on the set of louvers.

Step 11: Install the handle on the stem of the air control extension and tighten the setscrew using a 1/16" Allen wrench.

Section 3.0 Operation

3.1 Safety Information

1. This insert is designed for safe operation *WHEN BURNING CORDWOOD ONLY*. Altering or modifying the unit or the installation without proper authorization will void the certification, warranty, and safety listing, and may result in a safety hazard.
2. For safety reasons, never leave the unit unattended with the door open or ajar. An open door, and especially a door partially open or cracked, if left for longer than required for good ignition can potentially result in unsafe chimney temperatures, and if left unattended, hot embers or ignited fuel may fall out of the unit. Prolonged door open operation is not necessary provided the unit has been properly installed and dry kindling is used to start the fire.
3. Do not abuse the unit, either by over firing or by using wood or combustibles with salt content, or harmful chemicals. Misuse is not covered by warranty.
4. Even though your Osburn has been specifically designed and tested to prevent smoke spillage, always open the door slowly as this will minimize the likelihood of smoke spillage or a back draft causing flame or smoke to spill into the room.
5. Never use gasoline type lantern fuel, kerosene, solvents, charcoal lighter fluid, or inflammable liquids to start or "freshen" a fire in the insert. Keep all such liquids well away from the insert while it is in use.
6. All insert surfaces become very hot during operation. Care is needed, especially with children, to avoid contacting these surfaces.
7. Do not elevate the fire by means of grates, and irons or other means.
8. **CAUTION: DO NOT OVER FIRE THIS HEATER.** Do not burn fuel in the insert at a rate higher than that which will cause the ember bed level to exceed half the door opening height. If burning hot fires regularly, purchase an insert top thermometer, and do not exceed 840° F (450° C) as measured on the Cooktop. If the door handle of the insert becomes excessively hot to the touch, consider this to be an indication of over firing. Over firing can result in a safety hazard and can permanently damage the insert and chimney. This damage is not covered by the warranty.
9. Although the ceramic glass is extremely durable under any normal use, a few precautions are required. Do not attempt to push logs further into the fire by using the door, as the glass may break if it is heavily contacted by any solid object.

10. Never operate the insert with the door open, or cracked slightly open, except briefly during the lighting operation, and during refuelling. Leaving the door open continuously could seriously overheat the chimney and adjacent combustibles. Do not operate the insert if there is an abnormal air leakage into the unit, such as through deteriorated gaskets or cracked or broken glass. Do not operate the insert without a door gasket. Leakage can result in overheating, or in very airtight homes, could possibly cause smoke spillage into the room. Smoke may contain carbon monoxide, which is poisonous, and in sufficient quantities is a health hazard.
11. We recommend that you have a fresh air or make up air supply for the insert. In Canada this is a building code requirement. If this is not done, it could cause poor air quality in the home, poor and incomplete combustion, and poor efficiency in the insert.

3.2 Fuel

1. Fuel for the insert must not be stored closer than the required clearances to combustibles and not in the space required for ash removal.
2. Your Osburn insert is designed to burn *CORDWOOD FUEL ONLY*. Do not burn coal, charcoal, or trash in the unit. Highly flammable items such as trash may ignite creosote in the chimney, resulting in a chimney fire. Never burn salt wood, beachwood, chemically treated wood, or wood removed from salt water, since the deposits left will deteriorate the firebox. Damage caused by chemicals or salt is not covered under warranty.
3. Seasoned dense wood is recommended. Wood should be air dried in a covered ventilated area for six months to a year or more. This reduces the moisture content of the wood, resulting in better insert performance. Wood species with a moisture content of 20% or less are ideal. Dry seasoned wood can be distinguished from green wood by the checks or cracks in the ends.
4. Wet or green wood will tend to cause the fire to smoulder, producing large amounts of creosote. Creosote build-up could result in a chimney fire. This wood will also prove difficult to keep burning properly, and fires will tend to go out. Green wood produces very little heat, and sometimes causes customers to think that the insert does not work. If you must burn wet wood, use only small amounts mixed with dry wood.

5. Decayed wood or low density wood has very little energy content or heating value, and will not burn satisfactorily for long periods of time.

An example of the energy values of some common wood fuels is given in Table 3.1
For recommended wood sizes, refer to the specifications.

Common Heating Values of Cordwood

Hardwoods	Million Btu/Cord	Softwoods	Million Btu/Cord
Birch	23.6	Douglas Fir	20.6
White Oak	28.3	Hemlock	17.1
Alder	17.6	Jack Pine	18.4

Table 3.1

3.2.1 Simple Wood Moisture Test

Add one large piece of wood to the top of an established fire. If it starts to burn on three sides within one minute, it is dry and seasoned and right for burning. If it turns black and starts to burn in three minutes, it is damp. If it turns black and does not start burning until after five minutes, it is green and wet. If it hisses at any time the wood is soaked and will not burn until excess moisture is boiled away.

3.3 Notes About First Firing

Before firing ensure that the room is well ventilated.

Curing the paint is recommended to preserve the best quality finish. Heating the insert too intensely on the first fire will dull and lighten the colour on overheated areas, and cause smoke and odour to be emitted into the room. To cure the paint, the first two fires should be burned for only about twenty minutes each.

Allow the insert to get warm only, but not hot, i.e. 250° F (120° C) as measured by an insert top thermometer, then allow the insert to cool down. Light a third fire and burn it for about forty minutes to 450° F (230° C) or less. Once again cool the insert to room temperature, then operate it according to the following instructions. This extra care will result in a more durable, and uniform finish.

3.4 Lighting A Fire

1. Place enough crumpled balls of newspaper or other paper into the insert to cover the bottom of the firebox.
2. Place small dry kindling on the crumpled paper.
3. Place larger dry kindling on top of the small kindling.
4. Open the draft control fully to the right (located on the right side of the faceplate, Figure 3.1)
5. Light a fire at the bottom of the crumpled paper and close the door. If the fire tends to go out, momentarily hold the door slightly ajar to fan the fire. As soon as the fire catches hold, close the door.
6. Ideally the large kindling should be burned until a thick bed of red embers is obtained. At that point, add cordwood fuel and continue to operate the draft control wide open until the fire is well established. Once the firebox is hot, the draft control can be partially closed by moving the knob to the left to adjust the intensity of the fire.

Use Table 3.2 to adjust the draft control to the desired burn rate:

Draft Settings

Burn Rate	Draft Setting
Low	Move Control left to end of travel.
Medium Low	Move Control right by 9/16" - 1" (14.3 – 25.4mm) from closed position.
Medium High	Move Control right by 7/8" - 1 3/4" (22.2 – 44.5mm) from closed position
High	Move Control to right hand end of travel.

Table 3.2

Closing the draft control down too soon will lower combustion efficiency, and may result in creosote build-up in the chimney (which could lead to a future chimney fire).

CAUTION: THE ADJUSTMENT RANGE SHOULD NOT BE ALTERED FOR INCREASED FIRING FOR ANY REASON.

Figure 3.4

3.5 Maintaining The Fire

Your Osburn insert will work best if a thick bed of hot embers is maintained in the bottom of the firebox, and a minimum of two large pieces of seasoned fuel are added. Combustion efficiency is largely related to establishing a hot ember bed, and hot firebox temperatures. The quicker the insert and fuel get up to operating temperature, the better. A small intense fire is preferred to a large smouldering fire, both to improve combustion efficiency and to reduce the amount of creosote emitted. The best performance will be achieved by adding relatively small amounts of fuel to a well established ember bed, and then operating with the air inlet control open long enough to achieve a hot fire. Cordwood should be placed with air in between individual pieces. Use a poker to make an air channel in the embers below the wood, this will allow air to flow under the wood for a more efficient burn.

Extended burn times can be accomplished by first operating the insert on a full load with the air inlet controls wide open. Once the fire is well established, and the moisture has been driven out of the wood, reduce the air control to a lower setting. The unit should then burn cleanly without smouldering. If the fire smoulders without flame, re-establish a hotter fire before moving the air control to the lower setting. A yellow flame burning in the top of the firebox is a good indication of a clean efficiently burning fire.

Refuelling technique is important for good performance. The best efficiency and performance from your insert can be achieved by adding partial loads of fuel and allowing them to get up to operating temperature before adding additional fuel. Adding a large amount of fuel at one time will increase the time required to get the fuel up to its ignition temperature, and an extended time to reach optimal performance. When refuelling, open the air control or hold the door partially open 1" (25 mm) or less, long enough (less than 5 minutes) so that the fire has well established flames. When refuelling, care is required to ensure that fuel or embers do not fall out of the door opening. The unit will burn at about 2.0 to 2.5 lb/hr (.9 to 1.1kg/hr) at its minimum setting; approximately 20 to 25 lbs (9 to 11.3kg) of wood are required for an extended burn.

In order to achieve an optimum efficiency from your unit, we suggest that you operate it with the air control slightly open (approximately 10%). Make sure that you have a good fire going and an adequate ember bed before you completely close the air control. Closing the air control too soon will lower combustion efficiency and may cause the fire to die out. The addition of a blower (if not already included) is highly recommended to maximize your unit's efficiency.

3.6 Fan Operation

1. Allow the insert to reach operating temperature (approximately one hour), before turning on the fan, since increased airflow from the fan will remove heat and affect the start-up combustion efficiency.

2.

NOTE: ENSURE THE FAN CORD IS NOT IN CONTACT WITH ANY SURFACE OF THE INSERT TO PREVENT ELECTRICAL SHOCK OR FIRE DAMAGE. DO NOT RUN CORD BENEATH THE INSERT.

3. Turn the fan on or off with the variable speed control located on the left side of the fan assembly below the bottom louvre. The switch settings are Off, High and adjustable down to Low.

Section 4.0 Maintenance

4.1 Care And Cleaning

Clean the insert frequently so that soot, ash and creosote do not accumulate. Do not attempt to clean the insert, glass or door when the unit is hot. Special care must be taken with Gold surfaces in order to maintain the finish at its original brilliance. Do not use an abrasive glass cleaner which will scratch the glass or gold finish. Use only a soft clean damp cloth on the door, since some cleaners may remove the plating or paint.

4.1.1 Glass Cleaning

Under normal operation the stove is designed to keep the glass clean. Glass cleaning may be required when burning damp wood and/or when burning slow fires. Generally if the glass is not staying clean then the unit is being under fired. Dirty glass may be self-cleaned by burning a hot fire (i.e. dry wood and opened draft controls) for a couple of hours. Good burning techniques will result in clean glass.

Hand clean the glass only when the fire is out and the insert is cold. A light film can usually be cleaned with paper towel and water. If heavy cleaning is required, a ceramic glass cleaner or polish is recommended, and should be rinsed off with water for best results.

4.2 Ash Removal

CAUTION: *Ashes can start fires, even after several days of inactivity. Never dispose of ashes in a combustible container. Remove ashes only when the insert and ashes are cold.*

Ashes should be removed from the insert frequently. When ashes are removed, they should be placed in a metal container with a tightly fitting lid. The closed container of ashes should be placed on a non-combustible floor or on the ground, well away from all combustible materials, pending final disposal. If the ashes are disposed of by burial in soil or otherwise locally dispersed, they should be retained in the closed container until all cinders have thoroughly cooled. Do not place other waste materials in the metal ash container.

4.3 Chimney Cleaning

Regular chimney maintenance, as well as good burning practices, are required to prevent chimney fires. The chimney and the chimney connector pipe must be maintained in good condition and be kept clean for optimal safety. The chimney should be checked regularly for creosote build-up. Inspection and cleaning of the chimney can be facilitated by removing the baffle.

CAUTION: OPERATION OF YOUR OSBURN 2200 WITHOUT THE BAFFLE MAY CAUSE UNSAFE AND HAZARDOUS TEMPERATURE CONDITIONS AND WILL VOID THE WARRANTY.

Contact your local, municipal, state, or provincial fire authority for information on how to handle a chimney fire before there is any chance that it may happen.

Creosote – Formation And Need For Removal

When wood (especially green wood) is burned without adequate heat or air supply, it produces tar and other organic vapours (*smoke*), which combine with expelled moisture to form creosote.

The creosote vapours condense in the relatively cool chimney flue of a slow-burning fire. As a result, creosote residue accumulates on the flue lining. When ignited, this creosote makes an extremely hot fire, which could be hazardous. Check frequently for creosote build-up. In the event of an insert or chimney component failure, replace only with equipment that is equivalent to the original, available from your Osburn dealer.

Your Osburn insert has been designed to reduce the amount of creosote produced. Even so, the chimney connector pipe and chimney should be inspected at least once every two months during the heating season to determine if a creosote build-up has occurred. If creosote has accumulated, it should be removed to reduce the risk of chimney fire. Call a professional chimney sweep, or go to your local Osburn dealer and purchase a chimney brush, and have the chimney cleaned.

4.4 Baffle Installation and Brick Notes

1. Stack the baffle boards (A) on top of the vermiculite boards (B) as shown in figure 3.4a.

Figure 4.4a

- Put them on the horizontal air duct (C) (see figure 3.4b). Afterwards, push them towards the bottom and sides so that they rest on the back of the firebox (D) and on the side air ducts. Install the baffle support/extension (H) ensuring that it fits between the front risers and hold it in place. Install the front secondary air tube as show in figure 3.4c ensuring air holes face forward. Install the cotter pins as in fig 4.3. Installing the front secondary air tube (E) will stabilize baffle assembly during the next step.

Figure 4.4b

- Install the middle and rear secondary air tubes ensuring air holes face forward. Install the cotter pins as in fig 3.4.

Figure 4.4c – Baffle installation & removal

All firebrick and Duraboard baffles must be properly in place for correct burning operation. Have any damaged firebricks replaced. Check the firebricks annually for damage and replace if they are broken or damaged. See Figure 3.3 for the firebrick layout. Install the side & back firebricks first, and then the bottom firebricks.

Figure 4.4d – Firebrick layout

ITEM	PART #	DESCRIPTION	QTY
1	PL35030	BAFFLE INSULATION	2
2	21290	2200 BAFFLE (C-CAST)	2
3	PL35028	REAR SECONDARY AIR TUBE (STAINLESS STEEL)	1
4	PL35027	MIDDLE SECONDARY AIR TUBE (STAINLESS STEEL)	2
5	PL35029	FRONT SECONDARY AIR TUBE (STAINLESS STEEL)	1
6	30068	STAINLESS STEEL COTTER PIN	4
7	SE35031	2200 FRONT BAFFLE SUPPORT EXTENSION	1
8	PL35057	BRICK RETAINER (STAINLESS STEEL)	2
9	29011	YELLOW REFRACTORY BRICK 4" X 9" X 1 1/4"	6
10	29020	YELLOW REFRACTORY BRICK 4 1/2" X 9" X 1 1/4"	4
11	VP00012	YELLOW REFRACTORY BRICK 2 5/8" X 6" X 1 1/4"	2
12	29005	YELLOW REFRACTORY BRICK 6" X 8" X 1 1/4"	4

4.5 Secondary Air Tube Replacement

(see Figure 4.3)

1. Remove cotter pin at LH end of tube.
2. Slide tube to right and lower tube end below LH plenum.
3. Slide tube to left to remove.
4. Reassemble in reverse order using a new cotter pin. The cotter pin is a hammerlock style and locks into place by hitting the head sharply with a hammer.
5. Note that any tube can be replaced without disturbing the baffle.

Important Notes:

The air tubes are identified for placement as follows:

Front to back:	Tube No. 1	67 Holes	of .156" diameter
	Tube No. 2	67 Holes	of .140" diameter
	Tube No. 3	67 Holes	of .140" diameter
	Tube No. 4	67 Holes	of .125" diameter

Figure 4.5 – Secondary Air Tube replacement

4.6 Fan Maintenance & Care

Clean the fan air inlet louvres and squirrel cage impeller regularly. The fan should be kept clean and dust free. Life of the fan will be shortened if operated in a dust filled environment, or if the fan is overheated by restricting air supply. Stalling the rotor, or over firing the insert with the fan turned off will also damage the fan. The fan must not be overheated. Do not disassemble the fan. ***"ALTERING OR TAMPERING WITH THE FAN WILL VOID THE WARRANTY"***.

Section 5.0 Troubleshooting

Symptom	Possible Cause	Corrective Action
I Smoke in room	<ol style="list-style-type: none"> 1. Down draft 2. Chimney blocked 3. Chimney damper shut 4. Baffle out of position 5. New paint is curing 	<ol style="list-style-type: none"> 1. Upgrade chimney 2. Clean chimney 3. Open or remove damper 4. Correctly position baffle 5. Refer to instructions
II Wood burns poorly or is slow to start or no heat	<ol style="list-style-type: none"> 1. Low draw 2. Wet or decayed wood 3. Blocked intake air 	<ol style="list-style-type: none"> 1. Upgrade chimney 2. Use proper fuel 3. Check intake air supply by removing fan from insert and opening a window
III Dirty glass	<ol style="list-style-type: none"> 1. Insert is being under fired 	<ol style="list-style-type: none"> 1. Refer to instructions
IV Wood burns too fast	<ol style="list-style-type: none"> 1. Too much draft in chimney 	<ol style="list-style-type: none"> 1. Install manual damper in chimney connector pipe.

Section 6.0 Specifications

Fuel Type Cordwood

Test Standards ULC S628 (CSA B366.2) & UL 1482 residential.

Maximum recommended heating area : 500 to 2,000 square feet

Heating capacity* – BTU/hr., EPA test wood : 30 437 BTU/h.

Heating capacity* – BTU/hr., seasoned cordwood : 70 000 BTU/h.

Optimum efficiency : 76%

****Why is the BTU indicated on the EPA label smaller than the one advertised?***

You will notice a difference between the BTU output as indicated on the unit's white EPA label affixed to the glass and the BTU as advertised on our web site and/or product literature. The maximum BTU output we advertise for this unit is what will be obtained with a full load of seasoned cordwood inserted inside the firebox. The EPA output, on the other hand, is what has been obtained during emissions testing. The EPA test procedure requires that a special type of wood be used and positioned inside the firebox in a manner that does not represent the way the firebox volume would normally be utilized using seasoned cordwood. The EPA test load is typically much smaller. Hence, the BTU as per the EPA label is reduced. The BTU output that should be considered by a normal user is the one we advertise for seasoned cordwood.

Shipping Weight 383lbs (174kg)

Firebox Volume 2.2 cu.ft. (0.062 m³)

Firebox Floor Area 18 3/16 x 17 (478mm x 431mm)

Door Opening Size 21.2" wide x 9.2" high (538 mm wide x 234 mm high)

Maximum 18" (457 mm) if loading sideways

Log Size 16" (406 mm) if loading front to back

Flue Outlet 6" (152 mm) diameter (vertical)

Optional - 29 x 44 Faceplate

Components - 32 x 44 Faceplate

- 32 x 50 Faceplate

OSBURN LIMITED LIFETIME WARRANTY

The warranty of the manufacturer extends only to the original consumer purchaser and is not transferable. This warranty covers brand new products only, which have not been altered, modified nor repaired since shipment from factory. Proof of purchase (dated bill of sale), model name and serial number must be supplied when making any warranty claim to your OSBURN dealer.

This warranty applies to normal residential use only. Damages caused by misuse, abuse, improper installation, lack of maintenance, over firing, negligence or accident during transportation, power failures, downdrafts, or venting problems are not covered by this warranty.

This warranty does not cover any scratch, corrosion, distortion, or discoloration. Any defect or damage caused by the use of unauthorized parts or others than original parts void this warranty. An authorized qualified technician must perform the installation in accordance with the instructions supplied with this product and all local and national building codes. Any service call related to an improper installation is not covered by this warranty.

The manufacturer may require that defective products be returned or that digital pictures be provided to support the claim. Returned products are to be shipped prepaid to the manufacturer for investigation. If a product is found to be defective, the manufacturer will repair or replace such defect. Transportation fees to ship the product back to the purchaser will be paid by the manufacturer. Repair work covered by the warranty, executed at the purchaser's domicile by an authorized qualified technician requires the prior approval of the manufacturer. Labour cost and repair work to the account of the manufacturer are based on predetermined rate schedule and must not exceed the wholesale price of the replacement part. All parts and labour costs covered by this warranty are limited according to the table below.

The manufacturer at its discretion may decide to repair or replace any part or unit after inspection and investigation of the defect. The manufacturer may, at its discretion, fully discharge all obligations with respect to this warranty by refunding the wholesale price of any warranted but defective parts. The manufacturer shall in no event be responsible for any special, indirect, consequential damages of any nature, which are in excess of the original purchase price of the product. A one-time replacement limit applies to all parts benefiting from a lifetime coverage. This warranty applies to products purchased after October 1st, 2011.

DESCRIPTION	WARRANTY APPLICATION	
	PARTS	LABOUR
Combustion chamber (welds only), castings, convector air-mate, ceramic glass (thermal breakage only*), and secondary air tubes*.	Lifetime	5 years
Plating* (defective manufacture) – subject to limitations above.	Lifetime	n/a
Stainless steel firebox components, surrounds and heat shields, ash drawer, steel legs, pedestal, trims (aluminum extrusions), C-Cast baffle*, and vermiculite baffle*.	7 years	5 years
Carbon steel firebox components, glass retainers, and handle assembly.	5 years	3 years
Blowers, heat sensors, switches, rheostat, wiring, and other controls.	2 years	1 year
Paint (peeling), gaskets, insulation, firebrick, and ceramic fibre blankets.	1 year	n/a

**Pictures required*

Shall your unit or a components be defective, contact immediately your **OSBURN** dealer. Prior to your call make sure you have the following information necessary to your warranty claim treatment:

- Your name, address and telephone number;
- Bill of sale and dealer's name;
- Serial number and model name as indicated on the nameplate fixed to the back of your unit;
- Nature of the defect and any relevant information.

Before shipping your unit or defective component to our plant, you must obtain from your OSBURN dealer an Authorization Number. Any merchandise shipped to our plant without authorization will be refused automatically and returned to sender.
