When your Pellet Stove Room Heater is being installed on a combustible floor it is mandatory that a 1/2" (13mm) thick non-combustible hearth pad be installed under the heater. The non-combustible hearth pad must extend at least 6" beyond the fuel loading and ash removal openings and at least the depth of the heater plus 6 inches (152mm) out in front of the heater. This applies to both freestanding heaters and insert heaters.
